User

I'm trying to

Detection of Forest fire and smoke in wildland area is done by remote sensing methods.

Integral parts of many terrestrial eco-systems such as boreal, temperate forest.

But

The detection of fires will be the riskier process.

It leads to the wastage of lands.

Because

The earlier methods by detecting the fire will be useful in preventing the forest.

Forest fire prediction constitutes a significant component of forest fire management.

Which makes me feel

It plays a major role in resource allocation.

It includes mitigation and recovery efforts
